DATA OFFICER · PRESENTATION EXCERPT

From Data to a Story

I used this presentation to connect data collection, management and dissemination as one story, showing how changes in preparation support the people who use the results.

Visual excerpt from the presentation

Sources → managed data → audiences

Conceptual redraw of the presentation's source-to-audience map. Groups are simplified; no operational data or internal systems are shown.

01 / CONNECT

Retrieve from the source

Public API
Select and retrieve

→

R / Python
Reproducible retrieval

A direct connection to a published source.

The presentation showed how R and Python were used to retrieve data directly from the OECD and Statistics Canada through their APIs.

02 / STRUCTURE

Use a common shape

Series	Period	Value
Series A	Sample A	x
Series A	Sample B	y

Illustrative structure · symbolic values only.

Standardising on tidy data supports repeated processing and lets the same information move between analysis and visualization tools.

03 / REACH

Choose the output

Reports, presentations and dashboards give different audiences ways to use the results. The form follows the communication task.

> Automating reproducible preparation creates room for exploration, storytelling and communication.

Thomas Eapen
nowlabs.net/data-officer

Selected themes redrawn from the original presentation. Visuals are explanatory reconstructions; the table uses invented labels and symbolic values.
